Abstract. Five families and 100 species of Scarabaeoidea are recorded from Sarnena Sredna Gora Mts. Of these 63 species are new for the study region and for 84 new locality records are presented. The new records of the species *Geotrupes mutator* (Marsham, 1802), *Trox sabulosus sabulosus* (Linnaeus, 1758), *Aesalus scarabaeoides scarabaeoides* (Panzer, 1793), *Sinodendron cylindricum* (Linnaeus, 1758), *Platycerus caraboides* (Linnaeus, 1758), *Ochodaeus thalycroides* Reitter, 1892, *Aphodius coniugatus* (Panzer, 1795), *Onthophagus illyricus* (Scopoli, 1763), *Chaetonyx schatzmayri* Mariani, 1946, *Hoplia argentea* (Poda von Neuhaus, 1761), *Anisoplia dispar* Erichson, 1847 and *Protaetia affinis affinis* (Andersch, 1797) are of particular interest. The species *Aphodius foetidus* (Herbst, 1783) is reported for the second time for Bulgaria. The species *Lucanus cervus cervus* (Linnaeus, 1758) is included in the Directive 92/43/EEC on the conservation of natural habitats and wild fauna and flora.

Key words: Scarabaeoidea, Bulgaria, Sarnena Sredna Gora

Introduction

Systematic studies on Scarabaeoidea in Sarnena Sredna Gora Mts. had not been previously conducted. Faunistic research on this superfamily had been conducted in the neighboring regions Upper Thracian Plain (Zacharieva 1965a), Central and East Stara Planina Mts. (Zacharieva-Stoilova 1974). The dung beetles from the families Geotrupidae and Scarabaeidae in the other parts of Sredna Gora Mts. – Sashtinska and Ichitimanska – were studied by Todorov (2001a, 2001b, 2001c). Data about 37 species of the superfamily from Sarnena Sredna Gora can be found in the publications of Joakimov (1904), Pittioni (1940), Angelov (1965), Zacharieva (1965a), Rössner & Krell (2001), Rössner & Ahrens (2004), Lobo *et al.* (2011, 2015) and Bekchiev *et al.* (2018).

The purpose of the present work is to prepare a species list of the superfamily for the region of Sarnena Sredna Gora on the basis of the available records and a new collection material. The doubtful for the studied area records, as well as those from the neighboring localities (e.g. „Stara Zagora“, „Chirpan“, „Kazanlak“, „Yambol“ and „Karlovo“) are not

SCARABAEOIDEA

included in the species list and can also be found in the publications of Netolitzky (1912), Nedelkov (1905, 1909a, 1909b), Mikšić (1957), Kantardzhieva-Minkova (1953), Zacharieva-Stoilova (1951, 1962a, 1962b) and Guéorguiev & Bunalski (2004).

Materials and methods

Material for the present study has been collected by the authors in the period 2018 to 2020 from different localities and habitat types in Sarnena Sredna Gora. The collection methods included direct collection of beetles from plants or from dung of domestic animals, as well as pitfall and light trapping (UV and white lamps). The authors' studies covered mainly the Western part of the mountain, as well as a number of sites in the Chirpan Heights. Material collected by Dilian Georgiev from the Eastern part of the mountain in the period 2016-2018 and kindly provided by him for the present study was included as well.

The abbreviations of the collector's names, used in the species list are as follows: DGr – Denis Gradinarov, YP – Yana Petrova, IGr – Iliya Gradinarov, ECh – Evgeni Chehlarov, TT – Teodora Teofilova, NK – Nikolay Kodzhabashev, DGe – Dilian Georgiev. The abbreviation used for the collection methods are: *p/f* – collected from plants or flowers; *cD* – in cow dung; *hD* – in horse dung; *sD* – in sheep dung; *gD* – in goat dung; *cD/sD* – in cow and sheep dung; *cD/gD* – in cow and goat dung; *cD/hD* – in cow and horse dung; *pT* – by pitfall traps; *aL* – collected at light. The other abbreviations and symbols in the species list are as follows: ex. – specimen/s; obs. – the specimens were observed without collecting; * – the species is new for the studied area.

The higher classification of Scarabaeoidea, used in the species list, follows that in Ślipiński *et al.* (2011) and Löbl & Löbl (2016). The examined specimens are preserved in the Zoological Collection of Sofia University "St. Kliment Ohridski", Faculty of Biology, Sofia (BFUS) and in the collection of the Institute of Biodiversity and Ecosystem Research, Bulgarian Academy of Sciences, Sofia (IBER).

Conclusions

Five families and 100 species of Scarabaeoidea from Sarnena Sredna Gora Mts. are included in the list. Of these 63 species are new for the region and for 84 species new locality records are presented. Sixteen species are known only from old records in the literature.

The Western part of Sarnena Gora Mts. can be considered well studied area in regard to Scarabaeoidea with 78 species from various habitats recorded. The Eastern part was not systematically sampled and the data is insufficient for assessment of the species richness. The poorly studied region of Chirpan Heights is presented with only 18 species records. The sampling sites of three species – *Trox niger*, *Sisyphus schaefferi schaefferi* and *Cetonia aurata aurata* are the only situated within the territory of NATURA site “Chirpanski vazvishenia” (site code BG0000628).

The current species records for Sarnena Gora Mts. are approximately a third of all Scarabaeoidea species in Bulgaria – about 300 species according to Petrova *et al.* (2016). For the neighbouring regions – the Upper Thracian Plain, and for both Central and Eastern Stara Planina Mts., 99 and 108 species respectively, are known at present (Zacharieva 1965a, Zacharieva-Stoilova 1974). Considering the data presented and the fact that a few systematic faunistic studies concerning Scarabaeoidea in Bulgaria were recently published, we conclude that Sarnena Gora Mts. is a relatively well studied distinct area in the country.
